

## M40 / M30 (RS 485 interface)

Fig.1

## Application

### for the measurement of electrical variables in heavy current power system

485 bus interface (MODBUS®). It supervises several variables of an electrical power system simultaneously and generates 4 proportional analogue output signals.

The RS 485 interface enables the user to determine the number of variables to be supervised (up to the maximum available). The levels of all internal counters that have been configured (max. 4) can also be viewed. Provision is made for programming the M40 via the bus. A standard EIA 485 interface can be used, but there is no dummy load resistor for the bus.

to which a PC with the corresponding software can be connected for programming or accessing and executing useful ancillary functions. This interface is needed for bus operation to configure the device address, the Baud rate and possibly increasing the telegram waiting time (if the master is too slow) defined in the MODBUS® protocol.

The usual methods of connection, the types of measured variables, their ratings, the transfer characteristic for each output and the type of internal energy metering are the main parameters that can be programmed.

The ancillary functions include a power system check, provision for displaying the measured variable on a PC monitor, the simulation of the outputs for test purposes and a facility for printing nameplates.

concerning electromagnetic compatibility(EMC) and safety (IEC 1010 resp. EN 61 010). It was developed and is manufactured and tested in strict accordance with the quality assurance standard ISO 9001.

## Features / Benefits

- Simultaneous measurement of several variables of a heavy-current power system / Full supervision of an asymmetrically loaded four-wire power system, rated current 1 to 6 A, rated voltage 57 to 400 V (phase to neutral) or 100 to 693 V (phase-to-phase)
- For all heavy-current power system variables
- 4 analogue outputs
- Input voltage up to 693 V (phase-to-phase)
- Universal analogue outputs (programmable)
- High accuracy: U/I 0.2% and P 0.25% (under reference conditions)
- 4 integrated energy meters, storage every each 203 s, storage for: 20 years
- Windows software with password protection for programming, data analysis, power system status simulation, acquisition of meter data and making settings
- DC-/AC-power pack with wide power supply tolerance / universal
- securing it with screws to a wall or panel

Fig. 2. Block diagram.

The RS 485 interface of the M 40 is galvanically isolated from all other circuits. For an optimal data transmission the devices are connected via a 3-wire cable, consisting of a twisted pair cable (for data lines) and a shield. There is no termination required. A shield both prevents the coupling of external noise to the bus and limits emissions from the bus. The shield must be connected to solid ground

You can connect up to 32 members to the bus (including master). Basically devices of different manufacturers can be connected to the bus, if they use the standard MODBUS® protocol. Devices without galvanically isolated bus interface are not allowed to be connected to the shield.

The optimal topology for the bus is the daisy chain connection from node 1 to node 2 to node n. The bus must form a single continuous path, and the nodes in the middle of the bus must have short stubs. Longer stubs would have a negative impact on signal quality (reflexion at the end). A star or even ring topology is not allowed.

Fig. 6

There is no bus termination required due to low data rate. If you got problems when using long cables you can terminate the bus at both ends with the characteristic impedance of the cable (normally about 120 ). Interface converters RS 232 RS 485 or RS 485 interface cards often have a built-in termination network which can be connected to the bus. The second impedance then can be connected directly between the bus terminals of the device far most.

RS 485 interface can be realized by means of PC built-in interface cards or interface converters. Both is shown using i.e. the interfaces 13601 and 86201 of W & T (Wiesemann & Theis GmbH). They are configured for a 2-wire application with automatic control of data direction. These interfaces provide a galvanical isolation and a built-in termination network.

### Important

Each device connected to the bus must have a unique address  
All devices must be adjusted to the same baudrate.

### Symbols

| Symbols   | Meaning                                                                       |
|-----------|-------------------------------------------------------------------------------|
| X         | Measured variable                                                             |
| X0        | Lower limit of the measured variable                                          |
| X1        | Break point of the measured variable                                          |
| X2        | Upper limit of the measured variable                                          |
| Y         | Output variable                                                               |
| Y0        | Lower limit of the output variable                                            |
| Y1        | Break point of the output variable                                            |
| Y2        | Upper limit of the output variable                                            |
| U         | Input voltage                                                                 |
| Ur        | Rated value of the input voltage                                              |
| U 12      | Phase-to-phase voltage L1 – L2                                                |
| U 23      | Phase-to-phase voltage L2 – L3                                                |
| U 31      | Phase-to-phase voltage L3 – L1                                                |
| U1N       | Phase-to-neutral voltage L1 – N                                               |
| U2N       | Phase-to-neutral voltage L2 – N                                               |
| U3N       | Phase-to-neutral voltage L3 – N                                               |
| UM        | Average value of the voltages<br>$(U1N + U2N + U3N) / 3$                      |
| I         | Input current                                                                 |
| I1        | AC current L1                                                                 |
| I2        | AC current L2                                                                 |
| I3        | AC current L3                                                                 |
| Ir        | Rated value of the input current                                              |
| IM        | Average value of the currents $(I1 + I2 + I3) / 3$                            |
| IMS       | Average value of the currents and sign of the active power (P)                |
| IB        | RMS value of the current with wire setting range (bimetal measuring function) |
| IBT       | Response time for IB                                                          |
| BS        | Slave pointer function for the measurement of the RMS value IB                |
| BST       | Response time for BS                                                          |
| $\varphi$ | Phase-shift between current and voltage                                       |
| F         | Frequency of the input variable                                               |
| Fn        | Rated frequency                                                               |
| P         | Active power of the system $P = P1 + P2 + P3$                                 |
| P1        | Active power phase 1<br>(phase-to-neutral L1 – N)                             |
| P2        | Active power phase 2<br>(phase-to-neutral L2 – N)                             |
| P3        | Active power phase 3<br>(phase-to-neutral L3 – N)                             |

## MODBUS® (Bus interface RS-485)

|                        |                                              |
|------------------------|----------------------------------------------|
| Terminals              | Screw terminals, terminals 23, 24, 25 and 26 |
| Connecting cable       | Screened twisted pair                        |
| Max. distance          | Approx. 1200 m (approx. 4000 ft.)            |
| Baudrate               | 1200 ... 9600 Bd (programmable)              |
| Number of bus stations | 32 (including master)                        |
| Dummy load             | Not required                                 |

MODBUS® is a registered trademark of the Schneider Automation Inc.

## Analogue outputs →

For the outputs A, B, C and D:

| Output variable Y                                 | Impressed DC current                                           | Impressed DC voltage                                               |
|---------------------------------------------------|----------------------------------------------------------------|--------------------------------------------------------------------|
| Full scale Y2                                     | see "Ordering information"                                     | see "Ordering information"                                         |
| Limits of output signal for input overload and/or |                                                                |                                                                    |
| $R = 0$                                           | $1.25 \cdot Y2$                                                | 40 mA                                                              |
| $R \rightarrow \infty$                            | 30 V                                                           | $1.25 Y2$                                                          |
| Rated useful range of output load                 | $0 \leq \frac{7.5 \text{ V}}{Y2} \leq \frac{15 \text{ V}}{Y2}$ | $\frac{Y2}{2 \text{ mA}} \leq \frac{Y2}{1 \text{ mA}} \leq \infty$ |
| AC component of output signal (peak-to-peak)      | $\leq 0.005 Y2$                                                | $\leq 0.005 Y2$                                                    |

The outputs A, B, C and D may be either short or open-circuited. They are electrically insulated from each other and from all other circuits (floating).

All the full-scale output values can be reduced subsequently using the programming software, but a supplementary error results. The hardware full-scale settings for the analogue outputs may also be changed subsequently. Conversion of a current to a voltage output or vice versa is also possible. This necessitates changing resistors on the output board. The full-scale values of the current and voltage outputs are set by varying the effective value of two parallel resistors (better resolution). The values of the resistors are selected to achieve the minimum absolute error. Calibration with the programming software is always necessary following conversion of the outputs. Refer to the Operating Instructions

Caution: The warranty is void if the device is tampered with!

## System response

Accuracy class

## Vibration withstand

(tested according to DIN EN 60 068-2-6)

Acceleration  $\pm 2 \text{ g}$   
 Frequency range 10 ... 150 ... 10 Hz, rate of frequency sweep: 1 octave/minute  
 Number of cycles 10 in each of the three axes  
 Result No faults occurred, no loss of accuracy and no problems with the snap fastener

## Installation data

Housing HousingT24  
 See Section "Dimensioned drawings"

Housing material

Lexan 940 (polycarbonate), flammability class V-0 acc. to UL 94, self-extinguishing, non-dripping, free of halogen  
 For snapping onto top-hat rail (35 x 15 mm or 35 x 7.5 mm) acc. to EN 50 022 or directly onto a wall or panel using the pull-out screw hole brackets  
 Any  
 Approx. 0.7 kg

Mounting

Orientation  
 Weight

## Terminals

Type  
 Max. wire gauge

Screw terminals with wire guards  
 $< 4.0 \text{ mm}^2$  single wire or  
 $2 \times 2.5 \text{ mm}^2$  fine wire
